From Chapter 4 :

Additional Problem 1: Prove the Auxiliary Lemma we stated in Lecture 2. Namely prove the following:

A normed vector space $(X, \|\cdot\|)$ is *complete* if and only if every absolutely convergent series in X converges in X.

Recall; i) A series $\{x_n\}_n$ is said to be absolutely convergent if $\sum_{n=1}^{\infty} \|x_n\| < \infty$.
ii) A series $\sum_{n=1}^{\infty} x_n$ converges in X if there exists and x in X such that $\lim_{N\to\infty} \sum_{n=1}^{N} x_n = x$ in X; that is if $\| \sum_{n=1}^{N} x_n - x\| \to 0$ as $N \to \infty$

Additional Problem 2: For any $1 \leq p < \infty$ consider the space

$$L^p(\mathbb{R}^d) := \{f : \mathbb{R}^d \to \mathbb{C},\ \text{measurable},\ :\ \|f\|_{L^p(\mathbb{R}^d)} := \left(\int_{\mathbb{R}^d} |f(x)|^p \, dm\right)^{\frac{1}{p}} < \infty\}.$$

Assume that $\|f\|_{L^p(\mathbb{R}^d)}$ is a norm† whence $d_p(f,g) := \|f-g\|_{L^p(\mathbb{R}^d)}$ defines a metric and L^p is a metric space. Use the proof of completeness that I gave in class from Folland (Lecture 3) when $p = 2$ to **prove** that $L^p(\mathbb{R}^d)$ is *complete*.

(†) Question: can you guess what would you need to prove the triangle inequality when $p \neq 2$?. Justify your answer.

From Chapter 4 (pp 193-194): 1, 2*, 3, 4 (show completeness only), 5, 6, 7.
$*$ to show that $f - g$ is *orthogonal* to g you need to show that $\langle f - g, g\rangle = 0$.

SET 2 - Due 02/24/2026 by 5pm

From Chapter 4 (pp 195-197): 8a)

Pb. I. (This is an undergrad. problem but a very useful property to remember)
Let $\phi : \mathbb{R} \to \mathbb{R}$ be a periodic function with period p; that is $\phi(x + p) = \phi(x)$, $\forall x \in \mathbb{R}$. Assume that ϕ is integrable on any finite interval.

(a) Prove that for any $a, b \in \mathbb{R}$

$$\int_a^b \phi(x)dx = \int_{a+p}^{b+p} \phi(x)dx = \int_{a-p}^{b-p} \phi(x)dx$$

(b) Prove that for any $a \in \mathbb{R}$

$$\int_{-p/2}^{p/2} \phi(x+a)dx = \int_{-p/2}^{p/2} \phi(x)dx = \int_{-p/2+a}^{p/2+a} \phi(x)dx$$

In particular we have that $\int_a^{a+p} \phi(x)\, dx$ does not depend on a, as we discussed in class.

Pb.II. Consider $f \in L^2([-\pi,\pi])$ and assume that $\sum_{n\in\mathbb{Z}} a_n e^{inx} = f(x)$ a.e. x. Show that on any subinterval $[a,b] \subset [-\pi,\pi]$,

$$\int_a^b f(x)\, dx = \sum_n \int_a^b a_n\, e^{inx}\, dx.$$

In particular if $g(x) = \int_a^x f(y)dy$, the Fourier coefficients and series of $g(x)$ can be obtained from a_n, the Fourier coefficients of f.

Pb. III. For $0 < \alpha < 1$, we say that a function f is C^α-Hölder continuous with exponent α if there exists a constant $c = c_\alpha > 0$ such that $|f(x) - f(y)| \le c\,|x-y|^\alpha$ for all x, y. For $k \in \mathbb{N}$, we can also define the space $C^{k,\alpha}$ to be that of functions which are k-th times differentiable and whose k-th derivative is C^α-Hölder continuous (we could relabel C^α as $C^{0,\alpha}$). Consider now f a 2π-periodic $C^{k,\alpha}$ function. If a_n are the Fourier coefficients of f, show that for some $C > 0$ independent of n,

$$|a_n| \le \frac{C}{|n|^{k+\alpha}}$$

(Hint Integrate by parts and use periodicity.

Bonus Problem (do but do not turn in) : 2*a)b) from Chapter 4, pp 202.
